

SAIVEE- E-Commerce Management System

Java Swing Based E-Commerce Management System

PROJECT REPORT

Student	Kethana Sai Pranavi Atmuri
Register Number	24020112007
Programme	III B.S. Computer Science
Institution	Sri Sathya Sai Institute of Higher Learning
Project Type	Java Swing Desktop Application
Repository	kethanasaipranavi-max/SAIVEE-ECommerceManagementSystem: Java Swing based E-Commerce Management System

1. Abstract

SAIVEE (E-Commerce Management System) is a Java-based desktop application designed to simulate and manage the major operations of a modern online shopping platform. It provides separate customer and administrator workflows covering registration, authentication, product browsing, cart management, checkout, payment simulation, order processing, stock management, notifications, email communication, returns, refunds, and ratings and reviews.

The system is built around a realistic end-to-end customer journey. A customer registers and verifies an email address, shops through the catalogue, places an order, receives professional event-based emails, tracks the order, requests a return after delivery when eligible, and receives refund-related updates. Customers also keep a persistent order history and can submit ratings and reviews that appear in the product catalogue. Administrators manage orders, inventory, reviews, status changes and customer-facing communication.

Keywords: *E-commerce, Java, Swing, OTP verification, order management, inventory, returns and refunds, event-based email, layered architecture.*

2. Introduction and Problem Statement

Online shopping involves many connected processes: identity verification, catalogue management, payments, stock control, delivery tracking, and after-sales support such as returns and refunds. Small academic projects often implement only the ordering step and ignore the rest of the lifecycle, which leaves the system unrealistic and hard to evaluate.

2.1 Problem Statement

To design and develop a desktop e-commerce management system that covers the complete order lifecycle, from account creation to refund, with consistent stock handling, reliable customer communication, and separate role-based workflows for customers and administrators.

2.2 Motivation

- To demonstrate how multiple business modules work together in a single application.
- To apply object-oriented design and a layered architecture in a practical project.
- To handle real-world concerns such as stock consistency, email failures and eligibility rules for cancellations, returns and reviews.

3. Objectives

- Provide a user-friendly desktop e-commerce shopping experience.
- Maintain customer accounts and persistent order history based on customer identity/email.
- Support registration with email OTP verification.
- Provide cart, checkout, inventory reservation and payment simulation workflows.

- Generate transaction references and professional order, payment and refund emails.
- Support flexible order-status management from the administrator side.
- Provide a complete return lifecycle: request, pickup, inspection, approval/rejection and refund.
- Maintain notifications with read/unread state and notification history.
- Allow verified, delivered customers to rate and review purchased products.
- Allow administrators to reply to reviews and email the response to the customer.
- Keep product reviews and administrator replies visible in the shopping catalogue.
- Prevent stock-count inconsistencies during administrator stock removal.

4. Scope of the System

The system covers the functional areas below. Each area has a customer-facing side and a matching administrator side.

Table 1: Functional Areas by User Role

Area	Customer Functions	Admin Functions
Accounts	Register, login, email OTP verification, profile	Manage customer-related records
Catalogue	Browse products, view details, ratings and reviews	Add/update/remove products and stock
Cart & Checkout	Add/remove items, quantity, totals, checkout	Monitor orders and inventory
Payments	UPI/card/net banking/COD simulation, transaction reference	View payment/order information
Orders	History, status, cancellation, return where eligible	Select/update any supported order status
Returns & Refunds	Return request, reason, pickup/return tracking, refund updates	Review/approve/reject/record return and refund
Notifications	Read/unread and notification history	Monitor event notifications
Reviews	Rate/write review after delivery	Reply to reviews
Email	Receive event-based confirmations and updates	Customer communication through configured email service

5. User Roles

5.1 Customer

Customers can create an account, verify their email, log in, browse the catalogue, manage a cart, place orders, choose a simulated payment method, view order history, receive notifications, cancel eligible orders, request returns for delivered purchases, follow refund updates, and submit ratings and reviews for delivered products.

5.2 Administrator

Administrators manage products, stock, orders, payment/order information, customer-facing order statuses, return/refund processing and review responses. The upgraded status management lets an administrator select any supported status directly instead of following a fixed sequence.

6. Technology Stack

Table 2: Technologies and Components Used

Component	Technology / Purpose
Programming Language	Java
GUI	Java Swing
Development Environment	VS Code / Java Development Kit (JDK)
Data Storage	Local application data files / serialized records
Email	SMTP-based email service with configurable environment variables
Documents	Invoice generation and email attachment support
Architecture	Layered Java application with UI, service, model and utility components

7. System Architecture

The project follows a practical layered structure. Swing frames provide the user interface; service classes contain business operations such as orders, notifications, invoices and email; model classes represent entities such as products, orders and order items; and utility/validation classes support reusable checks. Separating these concerns keeps the code easier to maintain, test and extend.

Table 3: Architecture Layers and Responsibilities

Layer	Responsibility
UI Layer	Customer and administrator Swing frames; user input and display.
Service Layer	Order, payment, notification, invoice, email, return/refund and review operations.
Model Layer	Customer, product, order, order item and related domain objects.
Utility Layer	Validation and helper functions.
Persistence Layer	Local files/data records used to retain application history.

8. Customer Workflow

The end-to-end customer journey is summarised below. Each stage triggers the matching in-app notification and, where applicable, an email.

Table 4: Customer Journey Stages

Stage	Flow
Registration	Registration → Email address validation → OTP verification → Account creation
Login	Login → Customer identity recognised → Previous order history loaded
Shopping	Catalogue → Product details → Add to cart → Quantity management
Checkout	Checkout → Address/order summary → Payment method → Transaction reference
Order Placement	Order placement → Stock reservation/conversion → Order record → Notification → Professional email
Fulfilment	Processing → Shipping → Out for Delivery → Delivered
Review	Delivered → Review eligibility → Review submission → Catalogue display → Confirmation email
Return	Delivered → Return request → Reason → Pickup scheduling → Pickup → Inspection → Approval/Rejection → Refund processing

9. Payment Module

The payment module is an academic simulation supporting UPI, Card, Net Banking and Cash on Delivery (COD). It records transaction references without processing real money.

- A successful payment generates a transaction reference.
- COD records the order as a COD transaction.
- Failed or cancelled payments do not create false success records.
- Refunds record a refund reference and status.

10. Order Management and Statuses

The system supports the complete order lifecycle with direct administrator status selection. Returns are available only for delivered orders, and cancellation is allowed only for eligible orders.

Table 5: Supported Order Statuses

Status	Meaning
PLACED	Order created and recorded after checkout.
CONFIRMED	Order accepted and confirmed.
PROCESSING	Items are being prepared for dispatch.
SHIPPED	Order has been dispatched.
OUT_FOR_DELIVERY	Order is with the delivery agent.
DELIVERED	Order received; review and return become available.
CANCELLED	Order cancelled; stock released and refund handled if paid.

Status	Meaning
RETURN_REQUESTED	Customer has requested a return for a delivered order.
RETURNED	Returned item has been received/inspected.
REFUNDED	Refund has been processed and recorded.
FAILED	Payment or order failed; no success record is created.

11. Returns and Refund Management

- Customers can request returns for eligible delivered orders.
- The return reason and request details are recorded.
- Customers receive return notifications and emails.
- Administrators can approve or reject returns.
- Approved returns proceed to refund processing.
- The refund reference and status are recorded.
- Unpaid COD cancellations do not require a refund.

12. Professional Event-Based Email System

SAIVEE sends professional emails for important customer events.

Table 6: Email Events and Purposes

Event	Email Purpose
Registration	OTP verification
Order Placed	Order confirmation
Payment	Payment confirmation
Shipping	Shipping update
Out for Delivery	Delivery update
Delivered	Delivery confirmation and review invitation
Cancellation	Cancellation and refund information
Return Requested	Return confirmation
Return Approved/Rejected	Return decision
Refund	Refund information
Review Submitted	Review confirmation
Admin Review Reply	Reply notification

12.1 Email Content Principles

- SAIVÉE branding and professional layout.
- Customer name and order/reference number.
- Relevant order, payment or refund details.
- Clear next-step information.
- Plain-text fallback where required.
- Invoice/receipt attachment where configured.

13. Notification Center

- Creates in-app notifications for important events.
- Stores notification history.
- Supports read/unread status.
- In-app notifications remain available if email delivery fails.
- Email status can be tracked as pending, sent or failed.

14. Customer Profile and Persistent Order History

Customer accounts are linked to their profile and order history. After logging in again, customers can view previous orders, including order number, date, items, amount, payment reference and current status.

15. Ratings and Reviews

- Customers can review products only after delivery.
- Customers can provide ratings and written reviews.
- Reviews are stored with customer and order details.
- Reviews are displayed in the product catalogue.
- Review confirmation emails are sent to customers.
- Administrators can reply to customer reviews.
- Administrator replies are emailed and stored with the review.

16. Inventory and Stock Management

Inventory management ensures accurate stock updates. The system tracks the following stock states:

- Available stock
- Reserved stock
- Sold stock

- Released stock after cancellation or failure

Each stock action updates the quantity only once, which prevents incorrect stock calculations.

17. Administrator Module

- Admin login and dashboard.
- Product and catalogue management.
- Inventory and stock management.
- Order viewing and status management.
- Return and refund processing.
- Notification and email monitoring.
- Customer review management and replies.

18. Validation and Error Handling

- Validate customer details and email format.
- Prevent invalid quantities and stock shortages.
- Prevent duplicate or premature reviews.
- Handle payment, stock and return errors.
- Keep in-app notifications during email failures.
- Handle temporary email errors appropriately.

19. Security and Privacy Considerations

- Store SMTP credentials securely using environment variables.
- Never store passwords or app passwords in source code.
- Protect customer information.
- Use expiring, non-reusable OTPs.
- Do not store sensitive payment information.
- Clearly identify simulated payments and refunds.

20. Testing Plan

The test cases below verify the main workflows and the important edge cases of the system.

Table 7: Test Cases

ID	Test	Input / Action	Expected Result
T01	Registration	Valid email + OTP	Account created after verification
T02	Login	Existing customer email/account	Previous profile and order history appear

ID	Test	Input / Action	Expected Result
T03	Stock removal	Remove 4	Exactly 4 units removed
T04	Cart	Add / remove quantity	Cart and stock calculations remain correct
T05	Payment	UPI / Card / Net Banking / COD	Correct simulated payment outcome and reference
T06	Order	Place order	Order stored; confirmation email and notification created
T07	Admin status	Select any supported status	Status updates directly without forced sequence
T08	Delivery	Set order to DELIVERED	Customer becomes eligible for review
T09	Review	Submit rating + comment	Review saved and shown in catalogue
T10	Admin reply	Reply to review	Reply saved and emailed to customer
T11	Return	Delivered order + return reason	Return request created
T12	Refund	Approved return / eligible cancellation	Refund status/reference recorded and email sent
T13	Cancellation	Eligible order cancellation	Correct cancellation message and refund treatment
T14	Email failure	Temporary SMTP failure	In-app notification remains; email status records failure

21. Limitations and Future Enhancements

21.1 Current Limitations

- Payments and refunds are simulated; no real payment gateway is integrated.
- Data is stored in local files rather than a networked database.
- The application is a desktop client and is not accessible from the web or mobile devices.

21.2 Future Enhancements

- Integrate a real payment gateway with secure tokenisation.
- Migrate persistence to a relational database such as MySQL or PostgreSQL.
- Develop a web or mobile front end on top of the existing service layer.
- Add product search, filters, wishlists and recommendations.
- Add sales analytics dashboards and reports for administrators.
- Add SMS and push notification channels.

22. Conclusion

SAIVEE demonstrates a complete and realistic e-commerce workflow in a Java desktop application. It combines secure-style registration, catalogue and cart management, payment simulation, flexible order-status control, stock integrity, a full return and refund lifecycle, ratings and reviews, in-app notifications, and professional event-based email. The layered architecture keeps the system organised and ready for future extension, making it a strong academic project that applies core computer science concepts such as object-oriented design, validation, state management and error handling.

23. Output Screenshots

Insert your application screenshots in the following locations. Replace each placeholder with the relevant screenshot and add a short caption.

SAIVEE login / welcome screen - Displays the main application landing page with customer, admin and registration options.

Customer Registration - Allows a new customer to create an account by entering the required details.
